ABSTRACT

PURPOSE: To attain the display of transparency with high quality by
 producing successively the transparency display values from the inner side
 for each pixel regardless of the relative arrangement of plural transparent
 polygons, the presence/absence of crosses of these polygons.

09/892,773

CONSTITUTION: The depth values produced successively by an interpolation arithmetic unit 1 are compared with the depth width of a depth buffer set at the read side via a Z value comparator 3. Then a luminance calculating device 2 is actuated based on the comparison result of depth values. Thus the luminance value is obtained. At the same time, the produced depth value is supplied to a depth buffer set at the write side and an implicit-surface process is carried out with the preference given to the inner S side. A series of processes are carried out by plural times with exchange of roles of depth buffers. As a result, the display of transparency is attained with high quality without performing any sorting operation for each polygon.
